Static Tool

Expert-knowledge-based system to support planning of Small / Natural Water Retention Measures in rural landscapes

The computer application StaticTool.xlsm is enable the estimation of the effects of the implementation of a program of natural, small water retention measures (N(S)WRM) in a simplified way, which does not require the time-consuming and costly development of detailed models, hydrological or / and hydraulic, of the analysed catchment. This estimate is a grading, based on expert knowledge and is used to compare variants of the NSWRM program.

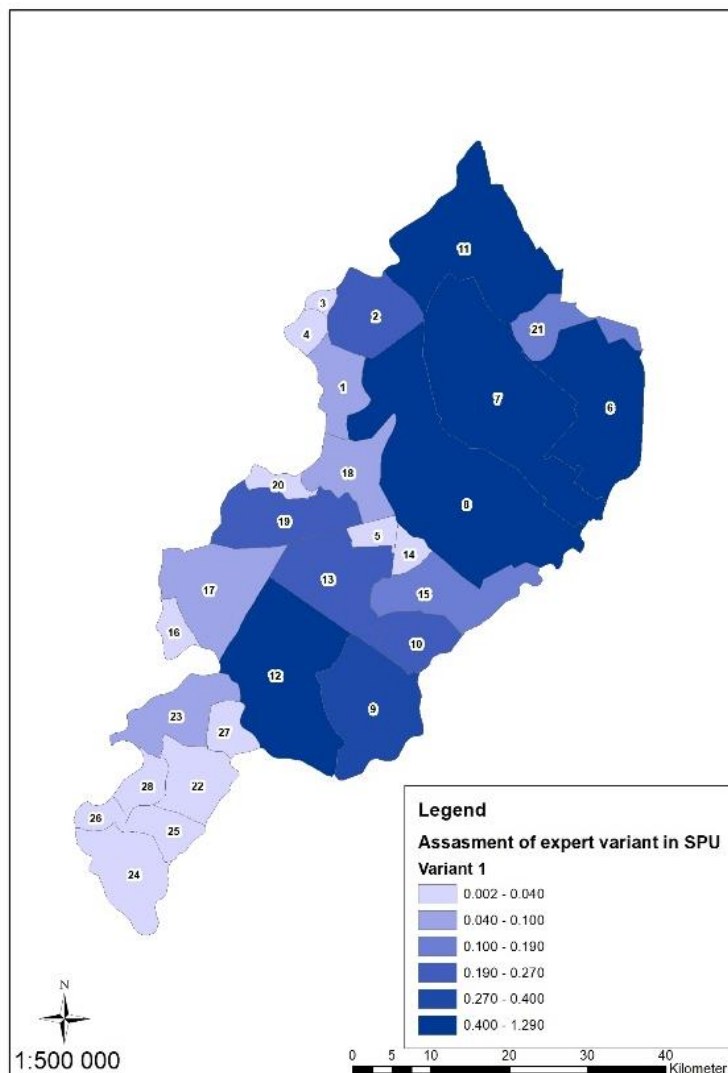

Figure 1 Map of assessment of expert variant at the SPU level in the Hungarian pilot river basin.

More detailed information about the Static Tool can be downloaded from here:
